QUESTION 1

✓ Correct Answer

Score 120

Truck Tour › Coding

Algorithms | Data Structures | Queues | Core CS

QUESTION DESCRIPTION

Suppose there is a circle. There are N petrol pumps on that circle. Petrol pumps are numbered 0 to $(N-1)$ (both inclusive). You have two pieces of information corresponding to each of the petrol pump: (1) the amount of petrol that particular petrol pump will give, and (2) the distance from that petrol pump to the next petrol pump.

Initially, you have a tank of infinite capacity carrying no petrol. You can start the tour at any of the petrol pumps. Calculate the first point from where the truck will be able to complete the circle. Consider that the truck will stop at each of the petrol pumps. The truck will move one kilometer for each litre of the petrol.

Input Format

The first line will contain the value of N.
The next N lines will contain a pair of integers each, i.e. the amount of petrol that petrol pump will give and the distance between that petrol pump and the next petrol pump.

Constraints:

$1 \leq N \leq 10^5$

$1 \leq \text{amount of petrol, distance} \leq 10^9$

Output Format

An integer which will be the smallest index of the petrol pump from which we can start the tour.

Sample Input

```
3
1 5
10 3
3 4
```

Sample Output

```
1
```

Explanation

We can start the tour from the second petrol pump.

CANDIDATE ANSWER

Language used: **C**

```

/*
 * Complete the 'truckTour' function below.
 *
 * The function is expected to return an INTEGER.
 * The function accepts 2D_INTEGER_ARRAY petrolpumps as parameter.
 */

int truckTour(int petrolpumps_rows, int petrolpumps_columns, int**
petrolpumps) {

long long total =0, bal =0;
int start = 0;
for(int i=0; i<petrolpumps_rows;i++){
    long long gain = petrolpumps[i][0] - petrolpumps[i][1];
    total += gain;
    bal += gain;

    if(bal<0){
        start = i+1;
        bal = 0;
    }
}

if(total>=0){
    return start;
}else{
    return -1;
}

}
```

QUESTION 2

✓ Correct Answer

Score 75

Pairs › Coding

Search | Algorithms | Medium | problem-solving | Core CS

QUESTION DESCRIPTION

Given an array of integers and a target value, determine the number of pairs of array elements that have a difference equal to the target value.

Example

$k = 1$

$arr = [1, 2, 3, 4]$

There are three values that differ by $k = 1$: $2 - 1 = 1$, $3 - 2 = 1$, and $4 - 3 = 1$. Return 3.

Function Description

Complete the *pairs* function below.

pairs has the following parameter(s):

- *int k:* an integer, the target difference
- *int arr[n]:* an array of integers

Returns

- *int:* the number of pairs that satisfy the criterion

Input Format

The first line contains two space-separated integers n and k, the size of arr and the target value.
The second line contains n space-separated integers of the array arr.

Constraints

- $2 \leq n \leq 10^5$
- $0 < k < 10^9$
- $0 < arr[i] < 2^{31} - 1$
- each integer $arr[i]$ will be unique

Sample Input

```
STDIN       Function
-----       --------
5 2         arr[] size n = 5, k =2
1 5 3 4 2   arr = [1, 5, 3, 4, 2]
```

Sample Output

```
3
```

Explanation

There are 3 pairs of integers in the set with a difference of 2: [5,3], [4,2] and [3,1]. .

CANDIDATE ANSWER

Language used: **C**

```
/*
 * Complete the 'pairs' function below.
 *
 * The function is expected to return an INTEGER.
 * The function accepts following parameters:
 *  1. INTEGER k
 *  2. INTEGER_ARRAY arr
 */

int compare(const void* a, const void* b ){
    int x = *(int*)a;
    int y = *(int*)b;
    return (x-y);
}

int binarySearch(int arr[], int n, int target){
    int l =0, r=n-1;
    while(l<=r){
        int mid = l +(r-l)/2;
        if(arr[mid]== target){
        return 1;
        }
        else if(arr[mid]<target){
             l= mid+1;
        }
        else{
```

```
        r = mid-1;
        }
    }
    return 0;
}

int pairs(int k, int arr_count, int* arr) {

qsort(arr, arr_count, sizeof(int), compare);

int count =0;
for(int i=0; i<arr_count;i++){
    if(binarySearch(arr, arr_count,arr[i]+k)){
        count++;
    }
}
return count ;
}

```

QUESTION 3

! Needs Review

Score 95

Big Sorting › Coding

Sorting · Strings · Algorithms · Easy · Data Structures · Arrays · problem-solving · Core CS

QUESTION DESCRIPTION

Consider an array of numeric strings where each string is a positive number with anywhere from 1 to 10^6 digits. Sort the array's elements in *non-decreasing*, or ascending order of their integer values and return the sorted array.

Example

$unsorted = [\text{'1'}, \text{'200'}, \text{'150'}, \text{'3'}]$

Return the array ['1', '3', '150', '200'].

Function Description

Complete the *bigSorting* function in the editor below.

bigSorting has the following parameter(s):

- *string unsorted[n]:* an unsorted array of integers as strings

Returns

- *string[n]:* the array sorted in numerical order

Input Format

The first line contains an integer, n, the number of strings in $unsorted$.
Each of the n subsequent lines contains an integer string, $unsorted[i]$.

Constraints

- $1 \leq n \leq 2 \times 10^5$
- Each string is guaranteed to represent a positive integer.
- There will be no leading zeros.
- The total number of digits across all strings in $unsorted$ is between 1 and 10^6 (inclusive).

Sample Input 0

```
6
31415926535897932384626433832795
1
3
10
3
5
```

Sample Output 0

```
1
3
3
5
10
31415926535897932384626433832795
```

Explanation 0

The initial array of strings is $unsorted = [31415926535897932384626433832795, 1, 3, 10, 3, 5]$. When we order each string by the real-world integer value it represents, we get:

$$1 \leq 3 \leq 3 \leq 5 \leq 10 \leq 31415926535897932384626433832795$$

We then print each value on a new line, from smallest to largest.

Sample Input 1

```
8
1
2
100
```

```
12303479849857341718340192371
3084193741082937
3084193741082938
111
200
```

Sample Output 1

```
1
2
100
111
200
3084193741082937
3084193741082938
12303479849857341718340192371
```

CANDIDATE ANSWER

Language used: **C**

```
/*
 * Complete the 'bigSorting' function below.
 *
 * The function is expected to return a STRING_ARRAY.
 * The function accepts STRING_ARRAY unsorted as parameter.
 */

/*
 * To return the string array from the function, you should:
 *     - Store the size of the array to be returned in the result_count
variable
 *     - Allocate the array statically or dynamically
 *
 * For example,
 * char** return_string_array_using_static_allocation(int* result_count) {
 *     *result_count = 5;
 *
 *     static char* a[5] = {"static", "allocation", "of", "string", "array"};
 *
 *     return a;
 * }
 *
 * char** return_string_array_using_dynamic_allocation(int* result_count) {
 *     *result_count = 5;
 *
 *     char** a = malloc(5 * sizeof(char*));
 *
 *     for (int i = 0; i < 5; i++) {
 *         *(a + i) = malloc(20 * sizeof(char));
 *     }
 *
 *     *(a + 0) = "dynamic";
 *     *(a + 1) = "allocation";
 *     *(a + 2) = "of";
 *     *(a + 3) = "string";
 *     *(a + 4) = "array";
 *
 *     return a;
 * }
 *
 */

 int comp(const void* a, const void* b){
    char* s1 = *(char**)a;
    char* s2 = *(char**)b;

    int len1 = strlen(s1);
    int len2 = strlen(s2);

    if(len1 != len2)
    return len1-len2;
    else
    return strcmp(s1, s2);
 }

char** bigSorting(int unsorted_count, char** unsorted, int* result_count) {

qsort(unsorted, unsorted_count, sizeof(char*), comp);
*result_count = unsorted_count;
return unsorted;

}
```
